The sequence contained an oligo-dT track that was present in the oligonuclectide that was used to prime the synthesis of first strand CDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the CDNA between the NotI site and the oligo-dT track served to verify it as a clone from the non-normalized embryo at 13 dpc library CDNA Library Preparation:
M.B. Soares Lab Clone distribution: clones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 4-123,
(GAA)n#Simple repeat 143-240, >1162_Send#LINE/Li
Seq primer: M13 Forward

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            2: SIDSI/gcgdata/geneseqp_embl/AA1980.DAT:*

This invention relates to a new isolated G-protein coupled receptor

(GPCRX) polypeptide, GPCRX mucleic acid and an antibody specific to the protein

are useful GPCRX mucleic acid and an antibody specific to the protein

are useful for treating, preventing or alleviating a GPCRX-associated

disorder or a pathological state in a subject, particularly a human. In

particular, the disorder is cardiomyopathy, atheroscierosis, diabetes,

or a disorder related to cell signal processing and metabolic pathway

modulation. The GPCRX polypeptide and nucleic acid are also useful for

diagnosing the presence of or predisposition to a disease associated

with altered levels of GPCRX, particularly cancer. The GPCRX nucleic

acid and polypeptide are especially useful in the manufacture of a

medicament for therapeutic or prophylactic applications for disorders

associated with aberrain GPCRX syression or activity, e.g. von

Hippel-Lindau syndrome, Alabeimer's disease, stroke, tuberous

celerosis, hypercalcaemia, Parkinson's disease, Huntington's disease,

cerebral palsy, epilepsy, Lesch-Hybna syndrome, multiple solerosis,

disease, infertility, hypertension, solecoporosis, inflammatory bowel

cerebral palsy, epilepsy, cerebroning disease,

disease, infertility, hypertension, solecoporosis, inflammatory bowel

disease, infertility, hypertension, solecoporosis, infertions, or graft-versus

constitute, tengal, bacterial or protocoal infections, or graft-versus

constitute, the above conditions. The polypeptides can be used as

indeveloping powerful assay system for functional analysis of various

the invention preventive and pharmacogenomics. The nucleic acids are

trying, preventive medicine, and pharmacogene can be used as

in developing powerful assay system for functional analysis of various

contents and proper and pharmacogenes. The played protein

content and proper and protein coupled receptor related protein

contents as well as a well as a sellan coupled receptor related protein
                                                                                                                                                                                                                               New isolated G protein coupled receptor polypeptides and polynuclectides, useful in gene therapy, particularly for treating or preventing cardiomyopathy, atherosclerosis, diabetes, multiple sclerosis, Crohn's disease or cancer.
                                                                                                                                                                                                                                                                                                                                                                            Claim 1; Page 98; 252pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (GPCR) of the invention.

The invention relates to isolated polynucleotide (I) and probes, polymeriae (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome company and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genee. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical inaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or cher traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences of the invention.

Combo to produce other types of data and products dependent on DNA and amino acid sequence of the invention.

Combo technologies of this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the viny point/pub/published_pot_sequences. 301 TPIIYFFASTHYRKWLLGILKLKGSSSSSSSSSSTPGKASSETPSITQARGSMFLAEHVV New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess Human, chromosome mapping, gene mapping, gene therapy, forensic, food supplement, medical imaging; diagnostic, genetic disorder.                                                                                                                                                                  BBV infected B lymphocytes recapitulate features of antigen stimulation in enlarging, increasing RNA synthesis, expressing activation antigens and adhesion molecules, secreting Ig and proliferating. Unlike antigens timulated B lymphocytes, BBV infected B lymphocytes continue to proliferate (in vitro) as immortalised lymphoblastoid cell lines. Because of the similar effects of EBV and antigen, EBV induced genes are likely to include mediators of antigen induced B lymphocyte growth or differentiation. Assessing or monitoring foetal or placental development - comprises detecting the level or size of Epstein Barr virus induced nucleic acid or protein in maternal serum samples
                                                                                                                                                                                                                            The present sequence was used in the development of a novel method for assessing or monitoring foetal or placental development. The method comprises taking a maternal serum sample, and detecting the level or sizé of Epstein Barr virus (EBV) induced gene or protein 3 (EBI-3) to obtain a result, which can be compared to a control to assess or monitor foetal or placental development.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      G protein-coupled receptor; GPCR; constitutively active;

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRS, AAY90643-AAY90677 and AAAY90677 and AAAY90677 and AAAY90643-AAY909-AA30743 and AAAY9079). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (TC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence of AAA) 15-pro. The endogenous mino acid is selected from Lys, His, Argor TA1, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Argor preferably Alactor and is preferably Lys. When the substituted amino acid and the Promap be endogenous, non-endogenous, or a mixture of endogenous and the Promonendogenous residues. The constitutively active GPCRS are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and settings for elucidating the roles of the receptors in normal and settings for elucidating the roles of the receptors in normal and diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used direatly for screening of compounds without the need for endogenous and income represents a human wild-type GPCR referred
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      241 GCLLTLIMLVAVVVCFSPYHLNIKQFMARGM--LHLPSCAERRAFILSLQATVALMNMNC 298
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ands. The present sequence represents a human wild-type GPCR referred in an exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            61 KINCTGIYLVHLAVSDLLFTVALPGRVVCYVLGSSWPPGKGLCRLTAFVLYTDTYGGVYL

(a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino caids. Also described: (I) an assay for the detection of a particular of protein-coupled receptor (GPCR) or a candidate polypeptide in a sample; and (2) an isolated antibody having high specificity and high affinity or avidity for a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibody against a particular GPCR, and in the production of specific an inbodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for treating immune-related diseases, growth-related diseases, cell regeneration-related diseases, immunological-related cell proliferative diseases, or autoimmune diseases, e.g. AlDS, Alaheimer's disease, atherosclerosis, bacterial, fungal, protozoan or viral infections, atherosclerosis, bacterial, fungal, protozoan or viral infections, consecutation, allergies, Crohn's disease, diabetes, graft versus host disease, Parkinson's disease, multiple sclerosis, pain, psoriasis, considers, depreseation, schizophrenia, dementia, mental retardation, memory consecutation, renal disorders, rheumatoid arthritis, trauma, ulcers, or any other disorder in which GPCRs are involved. The antibodies may be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               G protein-coupled receptor; GPCR; antigenic peptide; gene therapy; G protein-coupled receptor modulator; antibody; immune-related disease; growth-related disease; cell regeneration-related disease; Anner; immunological-related cell proliferative disease; autoimmune disease; Alzheimer's disease; atherosclerosis; infection; osteoarthritis; allergy; osteoporosis; cardiomyopathy; inflammation; Crohn's disease; diabetes; graft versus host disease; Parkinson's disease; multiple sclerosis; pain; psoriasis; anxiety; depression; schizophrenia; dementia; memory loss; mental retardation; epilepsy; asthma; tuberculosis; obesity; nausea; hypertension; hypotension; renal disorder; rheumatoid arthritis; trauma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease,

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-C AAY90677 and AAA30677, and to DNA encoding them (AAA30709-A330743 and AAA30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acids, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The amino acid stretch between the substituted amino acid and the Promay be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful for creaning for elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating siesses and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous constitutively active, they can be used the number of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention.

contraction relates to numen novee polymucterolluses and associated to polymptides are useful for treating inflammatory conditions such as arthritis, nephritis, Crohm's treating inflammatory conditions such as arthritis, nephritis, Crohm's disease, ischaemia-reperfusion injury, shock, sepsis, immune responses and cancer and for promoting wound healing. The sequences are used to induce the proliferation of neural cells and regeneration of nerve and induce the proliferation of neural and peripheral nervous system diseases and neuropathies, such as Alzheimer's disease, nervous system diseases and neuropathies, such as Alzheimer's disease, controlly a sequences are involved in chemicactic or chemokinetic activity, regulation of hematopoises, treatment of myeloid or lymphoid cell disorders and platelet disorders such as thrombocytopenia, call disorders and platelet disorders such as thrombocytopenia, collease. The sequences of the invention, ligament and/or merve tissue growth, tissue repair, healing of burns, incisions, ulcers, treatment of growth, tissue regeneration and treatment of lung or liver fibrosis, ortocection or regeneration and treatment of lung or liver fibrosis, repertusion injury in various tissues, immune deficiencies and disorders including severe combined immunodeficiency (SCID), bacterial or fungal infections, autoimmune disorders e.g. multiple sclerosis and myasthenia or gravis, allergic conditions such as asthma, thrombolysis or thrombosis or and coagulation of invarions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               9

New isolated nucleic acid encoding a new G-protein coupled receptor polypeptide for detecting receptor modulators that can treat mental disorders, such as schizophrenia, anxiety, depression, or obesity -

Claim 35; Page 83; 279pp; English.

Sequences AAU25554-AAU25616 represent human G-protein coupled receptor (GPCR) polypeptides of the invention. The proteins and their associated DNA sequences can be used to identify compounds which bind to GPCR polypeptides and in screening for compounds that modulate GPCR activity. By screening a human subject for the presence of mutations in GPCR activity. GPCR-related disorder or a genetic predisposition can be diagnosed. The asquences can also be used for treatment and prevention of mental disorders such as schizophrenia, attention deficit disorder, anxiety, depression, dementia and bipolar disorder, neurological disorders such as thuntington's disease, parkinson's disease and Tourette's syndrome, metabolic disorders such as obesity, anorexia and type 2 diabetes, cardiomyspathy and atherosclerosis, viral infections caused by HIV and

Non-endogenous constitutively activated numan G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical agents

Example 2; Page 233-234; 341pp; English.

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-CAAY0677 and AAY90677 and AAY90677 and AAY90677 and AAY30779-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous amino acid is selected from Lys, His, Arg or AA)15-Pro. The endogenous amino acid is selected from Lys, His, Arg or Lys, this residue is replaced by His, Arg or preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably has con-endogenous in on-endogenous, or a mixture of endogenous and non-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as electings for elucidating the roles of the receptors in normal and setting diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous considers and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used the novel mutant deciders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used the nead for endogenous and a normal and a disorders associated with the need for endogenous and the nead for endogenous and the nead for endogenous and nead for a particular GPCRs are constitutively active, they can be useful for the nead for endogenous and nead for endogenous and nead for endogenous and nead for endogenous and and nead for endogenous and and nead for endogenous and and nead for endogenous and and nead for endogenous and and human GPCRs of the invention.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pCR using two primers (AAQG6174, AAQG6175) was performed to amplify a partial sequence of the R20 seven transmembrane coding sequence which was later used as a probe for isolating the R20 genomic clone (AAQG6176) from a human placenta DNA library. During the isolation of the R20 gene, two weakly hybridising sequences were identified which had significant homology to other seven transmembrane receptors. The probe was used to screen a human genomic foetal liver DNA library, and while the R20 gene could not be identified in this library, several weakly hybridising clones were plaque purified, subcloned and sequenced. The two clones were designated R2 (AAG66177) and R12. This is the sequence encoded by the R12 clone. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           275 PSCAERRAFILSLQATVALMMNCGITPIIYFFASTHYRKWLLGIL---KLKG---SSSS

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents the human R12 protein which is encoded by the full length genomic R12 clone (AAV18356) which was isolated from a human genomic fetal liver DNA library. The invention claims for the full length V28 genomic DNA sequence (AAV18343) isolated from a human placenta genomic library. The V28 (AAW48722) and R12 proteins are seven transmembrane (T7M) receptors which are probably involved in signal transduction. The invention also claims that cells transformed with V28 DNA can be used to produce the recombinant polypeptide, to produce antigonists or in screening assays for V28 agonists or antagonists or antagonists or antagonists conditionally then be used to modulate V28 receptor-ligand binding, for e.g. in immunological and/or inflammatory events in vivo.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       96 WPFGKGLCRLTAFVLYTDTYGGVYLMACVSVDHYPAVVCAHWGPRLRTAGRARLVCVAIW

                                                                                                                                                                                                                                                                                                                                                           A novel human 7-transmembrane receptor (AAW07617) has been putatively identified as a G-protein thrombin receptor. Its amino acid sequence was deduced from a cDNA clone (AAT44092) discovered in a human infant brain cDNA library. Recombinant receptor can be produced in host cells (e.g. B. coli, COS-7, Sf9) and used to raise antibodies or to screen for (anti Jagonist cpda. Agonists can be used to treat e.g. haemophilia or to promote wound healing; antagonists can be used to treat inflammation, angina,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  FYTALLVFSALGNILALCLTCQKSRKINCTGIYLVHLAVSDLLFTVALPGRVVCYVLGSS

                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a novel seven transmembrane (7TM) receptors (also known as heptahelical, serpentine or G-protein-coupled receptors). The coding sequence for the present sequence may be used for gene therapy for diseases such as cancer.

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-CC AAY90677 and AAY90643-DAY90677 and AAA30779). The mutant proteins of the invention contain a and AAA30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (CC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence of X-(AA)15-pro. The endogenous amino acid is selected from Lys, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this constitution acid stretch between the substituted amino acid and the Prome and selected from Lys, His, Arg or Ala, and is preferably Lys. When the substituted amino acid and the Prome are also acid stretch between the substituted amino acid and the Prome and partial agonists for use as the mutant proteins are also useful for settings for elucidating the mutant proteins are also useful for settings for elucidating the roles of the receptors in normal and size and disorders associated with that receptor. Because the endogenous and disorders associated with that receptor. Because the novel mutant OPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous and ligands. The presents a human wild-type GPCR referred to in an exemplification of the invention.
